LOAD DESIGN CHARTS

When you choose R-Control SIPs, you're collaborating with a team of experts who work with you every step of the way. We're here to answer your questions, solve your problems, and do everything we can to make sure your project proceeds smoothly—and ends successfully.

R-Control SIPs are manufactured by a network of licensed manufacturers throughout North America and the world. R-Control SIP licensed facilities adhere to strict, consistent standards to ensure high-quality custom-made R-Control SIPs.

This network allows us to offer architects, engineers and builders the best of both worlds: the resources of the country's largest provider of SIP products and systems, and the superior attention and customer service of a local supplier.

R-Control SIPs are structural components for use in load bearing wall, roof, ceiling, or floor assemblies. An R-Control SIP Construction Manual, technical bulletins, and a building techniques video are available with additional information. These documents should be reviewed in detail prior to design and installation of R-Control SIPs. You can download these documents from www.r-control.com.

Architect/Engineering Review

The Load Design Charts for R-Control SIPs have been developed from national testing standards, testing at independent laboratories, and qualified structural engineers. These charts cover most common construction requirements. Each building project should be reviewed by an architect/engineer to determine the suitability of R-Control SIPs.

Evaluation Reports

The International Code Council Evaluation Service (ICC-ES) has reviewed the independent testing, structural engineering,

Building Codes

R-Control SIPs are recognized as being in compliance with the 2012, 2015, and 2018 International Building Code and 2012, 2015, and 2018 International Residential Code. R-Control SIPs should be designed to comply with the deflection limits of the applicable building code.

Wall-Unity Equation

This wall-unity equation is used to determine design suitability. The equation takes into account the ultimate load for a SIP subjected to both axial and transverse conditions:

$$\frac{\text{design axial load}}{\text{allowable axial load}} + \frac{\text{design transverse load}}{\text{allowable transverse load}} \leq 1$$
